Plain English Summary

Background and study aims

Centrally mediated pain can affect people with knee arthritis. We are looking to see if it can occur in people who have a broken knee also. This will also let us know if there are other things that can affect pain after a broken knee such as mood or activity

Who can participate?

People aged 18 years or older, who have had a broken knee in the last 8 years can be involved in the study

What does the study involve?

The study will involve answering questionnaires and some tests of pain around your knee. These tests use a pressure-measuring device to measure pain threshold.

What are the possible benefits and risks of participating?

There are no direct benefits for participants but they will help us understand the disease more.

Where is the study run from?

This study is run by the Academic orthopaedic department at Nottingham University hospitals (UK)

When is the study starting and how long is it expected to run for?

February 2024 to July 2027

Who is funding the study?

NIHR Nottingham Biomedical Research Council (UK)

Who is the main contact?

Dr Chris Busby, christopher.busby@nhs.net

Study information

Scientific Title

Centrally mediated pain following injury to the knee: a Cross-sectional study of pain and function following intra-articular knee injury

Acronym

ExploreKNEE

Study hypothesis

To assess the prevalence of centrally mediated features in those who have suffered an intraarticular knee fracture. This will be achieved by evaluating if intra-articular knee injury has a link with centrally mediated pain and psychological distress. This may improve our knowledge about the relationship between knee injury, surgery, psychological distress and pain, which may help advance interventions to improve health outcomes.

Study design

Observational cross sectional study

Primary study design

Observational

Secondary study design

Cross sectional study

Study setting(s)

Hospital, University/medical school/dental school

Study type(s)

Diagnostic

Participant information sheet

Not available in web format, please use the contact details to request a patient information sheet.

Condition

Prevalence of centrally mediated pain after intraarticular knee trauma

Interventions

Participants will be located from a database of trauma and will complete initial questionnaires remotely with a proportion being purposively sampled. These sampled participants will be assessed with further questionnaires and quantitative sensory testing.

Intervention Type

Other

Primary outcome measure

Measured at a single time point:

1. Features of centrally mediated pain measured using quantitative sensory testing (conditioned pain modulation, pressure algometry)
2. Central Aspects of Pain in the Knee Questionnaire (CAP-Knee)
3. Measures of Central sensitisation and neuropathic pain (Central sensitisation inventory (CSI), PainDETECT questionnaires)
4. Numerical Rating Scale (NRS)
5. Brief pain inventory (BPI)

Secondary outcome measures

Measured at a single time point:

1. Features of psychological distress measured using Hospital anxiety and depression scale (HADS)
2. Knee Function after trauma, measured using the The Knee Injury and Osteoarthritis Outcome Score (KOOS) and EQ-5D-5L

Overall study start date

10/02/2024

Overall study end date

01/07/2028

Eligibility

Participant inclusion criteria

1. Adult participants who attended Nottingham University Hospitals under the care of orthopaedic trauma and underwent treatment for intraarticular knee injuries from 2015-2023.
2. Must include one or more of the injury groups outlined below and include an intraarticular component as defined in AO Classification (2018) (1):
 - 2.1. Patella fracture
 - 2.2. Tibial plateau fracture
 - 2.3. Distal femur fracture
3. Able to give informed consent.
4. Able to complete required questionnaires.

Participant type(s)

Patient

Age group

Adult

Lower age limit

18 Years

Upper age limit

120 Years

Sex

Both

Target number of participants

80

Participant exclusion criteria

1. Aged 17 years or under
2. Concomitant fracture involving another joint
3. Intra articular knee fracture that involves preceding prosthesis or implant.
4. Active malignancy
5. Pregnancy or breast feeding
6. People in custody of the police or incarcerated persons
7. Inability to read or write English.

Recruitment start date

01/08/2024

Recruitment end date

01/08/2027

Results and Publications

Publication and dissemination plan

Results will be presented at local and international meetings and in appropriate peer-reviewed journals. Funding bodies and contributors will be acknowledged in publications arising from the study. The results may also form part of a PhD thesis

Intention to publish date

01/08/2028

Individual participant data (IPD) sharing plan

The datasets generated will be available on request from Chris Busby - Christopher.busby@nhs.net
