Study information

Scientific Title

A randomised trial to investigate the effects of pre-natal and infancy nutritional supplementation on infant immune development

Acronym ENID

. .

Study objectives

Early life immunocompetence can be enhanced by a 'life-course' approach to achieve nutritional repletion in late gestation and infancy.

Ethics approval required Old ethics approval format

Ethics approval(s) The Gambia Government/MRC The Gambia Joint Ethics Committee, 20/08/2008, ref: SCC 1126v2

Study design Three-way randomised controlled trial

Primary study design Interventional

Secondary study design Randomised controlled trial

Study setting(s) Other

Study type(s) Treatment

Participant information sheet

Health condition(s) or problem(s) studied

Optimisation of nutritional status for immune development

Interventions

Four pregnancy interventions, to be given daily from 12 weeks gestation until delivery: 1. FeFol: Iron-folate, 60 mg iron 400 µg folate, representing the usual standard of care during pregnancy, as per Gambian Government guidelines (control group).

2. MMN: Multiple micronutrients. A combination of 15 micronutrients, specifically designed for

use during pregnancy, and as formulated by UNICEF. A single tablet provides the Recommended Dietary Allowance (RDA) for each micronutrient, but we will supplement women in this arm of the trial with two daily MMN tablets.

3. PE + FeFol: Protein-energy and iron-folate. A food-based supplement developed by Valid International, providing a comparable level of iron and folate to the FeFol only arm, but with the addition of energy, protein and lipids.

4. PE + MMN: Protein-energy and multiple micronutrients. A micronutrient fortified food-based supplement also developed by Valid International, and providing comparable levels of micronutrients to the MMN arm (including FeFol), in addition to the energy and protein and lipid content.

From 6 months of age, infants will further be randomised to receive a nutrient enriched weaning food fortificant or placebo, and for a period of 6 months.

Intervention Type

Other

Phase Not Applicable

Primary outcome measure

- 1. Thymic index at 1, 8, 24 and 52 weeks of age
- 2. Antibody response to EPI vaccines (diphtheria, tetanus toxoid, HiB, measles)

Secondary outcome measures

Cellular markers of immunity in a randomly selected sub-cohort of infants, stratified by treatment group. The secondary outcome measurements will be assessed when the infants are 12, 24 and 52 weeks of age.

Overall study start date 01/10/2009

Completion date

30/09/2013

Eligibility

Key inclusion criteria

Amended as of 04/10/2010: Women (aged 18 to 45 years) resident in Kiang West Region, The Gambia, with pregnancy confirmed by urine test and ultrasound examination and with gestational age approximately 10 -20 weeks.

Initial information at time of registration:

Women (aged 18 to 45 years) resident in Kiang West Region, The Gambia, with pregnancy confirmed by urine test and ultrasound examination and with gestational age approximately 12 weeks

Participant type(s)

Patient

Age group Adult

Lower age limit

18 Years

Sex Female

Target number of participants 800 mother-infant pairs

Total final enrolment

875

Key exclusion criteria

Amended as of 04/10/2010: 1. Currently enrolled in another MRC study or current pregnancy (beyond 20 weeks on ultrasound assessment) 2. Severe anaemia (haemoglobin [Hb] less than 7 g/dL) 3. Reported onset of menopause

Initial information at time of registration:

1. Currently enrolled in another MRC study or current pregnancy (beyond 12 weeks on ultrasound assessment)

2. Severe anaemia (haemoglobin [Hb] less than 7 g/dL)

3. Reported onset of menopause

Date of first enrolment 01/10/2009

Date of final enrolment 30/09/2013
