Study information

Scientific Title

Study hypothesis
By inducing a shift of fat out of the visceral compartment - among which the pancreas - into the subcutaneous compartment, rosiglitazone results in improved pancreatic beta-cell function in type 2 diabetes patients, as compared to a sulfonylurea derivative, while both groups continue metformin treatment.

Ethics approval required
Old ethics approval format

Ethics approval(s)
Received from local medical ethics committee

Study design
Randomised active controlled, parallel group trial

Primary study design
Interventional

Secondary study design
Randomised controlled trial

Study setting(s)
Not specified

Study type(s)
Treatment

Participant information sheet

Condition
Diabetes mellitus type II (DM type II)

Interventions
Patients will be randomised to 26 weeks of treatment with metformin with glimepiride 4 mg a day or metformin with rosiglitazone 8 mg a day. Before the start of the treatment patients will undergo a 200 minute hyperglycaemic (aiming at 15 mmol/l) clamp with administration of glucagon-like peptide-1 (GLP-1) starting at 120 minutes and an arginine bolus at 180 minutes to elicit a further beta-cell response. Twenty-six weeks later, the assessments will be repeated, again on metformin, other study medication taken until the morning before this assessment.

Intervention Type
Drug

Phase
Not Specified

Drug/device/biological/vaccine name(s)
Rosiglitazone, glimepiride, metformin, glucagon-like peptide-1, arginine

Primary outcome measure
The peak insulin concentrations during the hyperglycaemic clamp protocol.

Secondary outcome measures
No secondary outcome measures

Overall study start date
01/09/2004

Overall study end date
01/04/2007

Eligibility

Participant inclusion criteria
1. Informed consent form signed
2. Type 2 diabetes patients, according to World Health Organization (WHO) criteria
3. Age 18 - 70 years
4. Use of metformin, at least 500 mg a day
5. HbA1c greater than 7.0% inclusive when on metformin alone, or greater than 6.5% when on combination therapy of metformin and a sulfonylurea derivative. Use of a sulfonylurea derivative is allowed, with a wash-out period of four weeks before the first assessments.

Participant type(s)
Patient

Age group
Adult

Lower age limit
18 Years

Sex
Both

Target number of participants
22

Participant exclusion criteria
1. Established coronary heart disease
2. Previous use of a thiazolidinedione

Recruitment start date

01/09/2004

Recruitment end date
01/04/2007
