Plain English Summary

Background and study aims

Autism spectrum disorders (ASDs) involve impairments or delayed development in social interaction and communication skills. A wide range of different approaches have been used to help children with ASD develop these skills. However, there is little evidence of effectiveness for most of these methods. Music therapy has been used to treat ASD for a long time, and there are many studies suggesting that music therapy may enhance social communication skills. The aim of this study is to find out about the effects of improvisational music therapy on the social communication skills of children with ASD. Additional aims are to examine if changing the number of music therapy sessions per week affects the outcome of therapy, and to determine cost-effectiveness.

Who can participate?

Children aged between 4 years and 6 years 11 months diagnosed with ASD. Participating children must not be affected by serious sensory disorders (blindness, deafness) and must not have received music therapy in the last 12 months

What does the study involve?

Participants are randomly allocated to one of three groups:

1. High-intensity music therapy (improvisational music therapy sessions three times per week for five months, and three sessions of parent counselling).

2. Low-intensity music therapy (improvisational music therapy sessions once a week for five months, and three sessions of parent counselling).

3. Standard care (three sessions of parent counselling).

Improvisational music therapy is a flexible, child-centred method where a trained therapist reacts musically to the childs (musical or other) behaviour and expression and uses various improvisational techniques to engage the child, establish contact, and enter a dialogue with him /her. While engaging in joint musical activities within a shared history of interaction, the child is offered opportunities to develop and enhance skills that are associated with later development in language and social competency.

What are the possible benefits and risks of participating? There are no direct benefits or risks involved with participating in this study. Where is the study run from?

Uni Research Health, The Grieg Academy Music Therapy Research Centre (GAMUT), Bergen (Norway)

When is the study starting and how long is it expected to run for? August 2011 to December 2016

Who is funding the study?

1. The Research Council of Norway (Norway)

2. POLYFON Knowledge Cluster for Music Therapy, The Grieg Academy Department of Music, University of Bergen (Norway)

- 3. Melbourne Conservatorium of Music, The University of Melbourne (Australia)
- 4. Danish Council for Independent Research/Humanities (FKK) (Denmark)
- 5. Doctoral Programme in Music Therapy, Aalborg University (Denmark)
- 6. Faculty of Psychology, University of Vienna (Austria)
- 7. Research Incentive Fund (FIPE) of the Hospital de Clínicas de Porto Alegre (HCPA) (Brazil)
- 8. IRCCS Stella Maris Foundation, Pisa (Italy)
- 9. University of Pisa (Italy)
- 10. Research Institute of Health and Science, Jeonju University (Korea)
- 11. Health Authority of Western Norway (Norway)
- 12. Bergen municipality, Bergen culture school (Norway)
- 13. Fjell municipality, Fjell culture school (Norway)
- 14. National Institute for Health Research (UK)
- 15. Cambridge and Peterborough Foundation NHS Trust (UK)
- 16. The Evelyn Trust (UK)
- 17. Cambridgeshire Music (UK)
- 18. Anglia Ruskin University (UK)
- 19. Molloy College (USA)
- 20. Mid-Atlantic Region of the American Music Therapy Association (USA)

Study information

Scientific Title

Randomised controlled Trial of Improvisational Music therapy's Effectiveness for children with Autism spectrum disorders (TIME-A)

Acronym

TIME-A

Study hypothesis

Music therapy is superior to standard care in improving social communicative skills in children with autism spectrum disorders (ASD) as assessed by blinded clinicians at the end of the treatment period

Secondary hypotheses

 Music therapy is superior to standard care in improving social responsiveness in children with ASD as assessed by parents/guardians at the end of the treatment period
 Change in social communicative skills and social responsiveness varies with variation of treatment intensity

3. Changes in social communicative skills and social responsiveness are sustained until seven months after ending of treatment

Ethics approval required

Old ethics approval format

Ethics approval(s)

Approval by the responsible ethics committees will be secured before the start of participants enrolment at each site

Study design Multi-centre three-arm single (rater) blind randomised controlled trial of intervention

Primary study design Interventional

Secondary study design

Randomised controlled trial

Study setting(s)

Other

Study type(s)

Treatment

Participant information sheet

Not available in web format, please use the contact details to request a patient information sheet

Condition Autism spectrum disorders

Interventions

1. Individual improvisational music therapy over a period of 5 months, one session (low-intensity) or three sessions (high-intensity) per week

2. Standard care in all treatment arms: 3 sessions of parent counselling at 0, 2, and 5 months

Intervention Type

Other

Phase Not Applicable

Primary outcome measure

Autism Diagnostic Observation Schedule (ADOS) Social Affect score at 5 months

Secondary outcome measures

1. ADOS at 2 and 12 months

2. ADOS subscales: Communication, Reciprocal Social Interaction, Imagination/Creativity, Stereotyped Behaviors and Restricted Interests, at 2, 5, and 12 months

3. Social Responsiveness Scale (SRS) as rated by parents/guardians at 2, 5, and 12 months 4. SRS subscales: Social Awareness (receptive aspects of social behavior), Social Cognition (social information processing), Social Communication (capacity for reciprocal social communication), Social Motivation (social anxiety/avoidance), Autistic Mannerisms (autistic preoccupations and traits)

5. Cost-effectiveness ratios and incremental cost-effectiveness ratios for the different alternatives (Cost will be measured as real resources used in treatment, in terms of personnel hours of work; effectiveness is measured by ADOS)

Added 05/06/2017:

6. Ratings of quality of life of the child and of the family as a whole, respectively, at 2, 5 and 12 months

7. Adverse events

8. Binary analysis of proportion of participants who improved on the primary outcome

Overall study start date

01/08/2011

Overall study end date 31/12/2016

Eligibility

Participant inclusion criteria

1. Aged 4 years to 6 years, 11 months

2. With a diagnosis of autism spectrum disorder according to ICD-10 criteria as assessed by a child psychiatrist or clinical psychologist; diagnosis of ASD needs to be reconfirmed in the baseline assessment with children fulfilling diagnostic criteria for ASD on both the Autism Diagnostic Observation Schedule (ADOS) and the Autism Diagnostic Interview-Revised (ADI-R)

Participant type(s) Patient

Age group Child

Lower age limit 4 Years

Upper age limit 6 Years

Sex Both

Target number of participants 300 (75 in each intervention arm, 150 in the standard care condition)

Participant exclusion criteria

Children with serious sensory disorders (blindness, deafness)
 Children who have had any previous experience of music therapy

Recruitment start date 01/11/2011

Recruitment end date 10/11/2015
